INTRODUCTION

Information presented in this report is taken from the Employment Security's ESARS (Employment Service Automated Reporting System) and the ES 203 monthly report.

Occupations are broken down into 9 categories with various divisions for each category, as specified in the Dictionary of Occupational Titles, the most detailed and comprehensive of occupational classification systems in use today.

Section one provides information on characteristics of the insured unemployed including sex, race (white or non-white), average claim duration, and occupation.

Section two deals with job openings within Montana, including total number of jobs received, total number filled and total number unfilled. Information is also given on the characteristics of claimants who are presently seeking work through Montana Job Service Offices.

D.O.T. - Dictionary of Occupational Titles

UNEMPLOYMENT SITUATION

Insured Unemployment has steadily declined (a positive effect) for the first six months of 1977, with June's insured unemployment rate reaching a low for the year of 2.6%. Although the insured unemployment rate has steadily declined, June shows a slight change in this trend, with an increase in unemployment claims in the professional, technical and managerial and service occupations.

Out of the total increase of claims in the professional, technical and managerial field, the majority are related to educational services.

The increase of claims for this category is due to the increase of educational workers who either have been laid off or have no contract for next fall, therefore becoming eligible for unemployment benefits.

Occupations contributing to the increase of claims in the service category were: chefs and cooks for large hotels and restaurants, kitchen workers, and porters and cleaners.

JOB OUTLOOK

The occupational category with the largest number of openings unfilled after 30 days was the service category. Waiter/waitress and hospital attendant were the major occupations contributing to job openings.

Close behind was the professional, technical and managerial category with a monthly average of 141 unfilled job openings over 30 days old for the second quarter of 1977. Within this category, three specific occupations have been in demand since the beginning of 1977. These professions include registered nursing, medicine and health occupations, and accounting and auditing. An average of approximately 50% of these job openings were not filled within 30 days. Unemployment characteristics

indicate that 8 claimants (11.3% of category total) are receiving benefits in the medicine and health field. The inconsistency in job openings and unemployed claimants may be due to the difference between job requirements, job qualifications, job location, and claimant location. Job opportunities appear to be good for people in the above three categories.

SECTION I

CHARACTERISTICS OF THE
INSURED UNEMPLOYED^{1/}

{FIGURES ARE FOR THE WEEK
INCLUDING THE 12th DAY OF THE MONTH.}

^{1/} SOURCE - ES-203 REPORT

Table 1 provides a breakdown of unemployment claims by industry. The average duration column represents the length of time that insured unemployed workers have been drawing benefits.

The construction industry accounts for the largest portion of unemployed workers with the trade and service industries a close second. Their combined totals represent 67.7% of total claims filed. The greatest number of female and male insured unemployed was in services and construction. Quarterly figures show that the average duration of claims in the trade, the finance, insurance and real estate, and the public administration industries exceed the overall claims duration by two weeks.

Table 2 supplements the information provided in Table 1 by listing the number of claims in two major local offices, Billings and Great Falls.

Table I shows where unemployed claimants were last working, Table III shows what type of work these claimants were doing.

The highest number of unemployed workers are found in the structural work category. Workers in this trade represent 32.5% of total claims filed for the second quarter. Miscellaneous occupations rank second representing 18.5% of total claims filed. It is interesting to note that the number of claims in structural work dropped from 34.6% of total claims in April, to 26.5% of total claims in June. This can be accounted for by increased construction activity during summer months. This increase in construction activity can be expected to keep structural work unemployment to a minimum during summer months.

Table IV gives a breakdown of unemployment claims by occupational category for the Billings and Great Falls areas.

Table V gives a more complete breakdown of the information presented in Table III. Any specific division (occupation) which represents over 10% of the claims filed for the category which it is listed under is considered. The total claim figure in this division is compared to the claim figure for its category and a percentage is listed. The following occupations consistently held over 10% of their category total for the second quarter 1977: administrative specializations, computing and account recording, sales clerks, ore refining and foundry operations, auto mechanic supervisor, excavating, paving, grading and related, carpenter, measurer for construction, and heavy truck drivers.

Table VI compares claims duration for white, non-white, male and female claims. Average duration of female claims exceeded total average claims duration and average male claims duration during April and May. In June, female claim duration dropped and male claim duration increased.

Table VII lists occupations and number of claimants for any occupation with an average claim duration of over 20 weeks. The high duration of claims in these occupations signify some difficulty in job placement.

Table VIII gives a summary of previous data. Percent distributions are listed for female, male, white, and non-white claimants.

A breakdown of recent changes in unemployment is listed on Table IV. The number of unemployed has been consistently dropping since January 1977. A seasonal trend toward fewer unemployed is seen; however, note that unemployment increased in professional, technical and managerial and service occupations between May and June.

UNEMPLOYED CLAIMANT CHARACTERISTICS BY
MAJOR OCCUPATIONAL GROUP

(Second Quarter 1977)

SECTION II

UNFILLED JOB OPENINGS^{1/}

^{1/} SOURCE - EMPLOYMENT SERVICE AUTOMATED REPORTING SYSTEM

The information on Table X through Table XII is taken from ESARS and deals with job openings in the state of Montana.

Table X gives a list of jobs with 10 or more unfilled openings. Hard-to-fill openings can be detected by the use of this table. The occupations which were in constant demand during the second quarter were: computing and account recording, sales clerks, waiter, waitress and related, miscellaneous construction, and packaging and materials handling.

Table XI summarizes job placement activity for the state. Note that the category of other services had the largest number of job openings unfilled after 30 days with professional, technical, and managerial occupations close behind.

Table XII provides a breakdown of characteristics of applicants in the active files of Montana's local job service offices.
